

1987-90 Throttle Body Up-Grade

This kit is designed to up-grade the early three hole throttle body to the 1991-up four hole, larger bore unit. Ideal for engine conversions to change the early Renix igniton system to the later Bendix system is desired. By up-grading your "old" system you now have a broader range of performance items available.

Remove your existing throttle body. Install the adapter and new three hole throttle body gasket using the three countersunk screws provided. Install the cable bracket support. Leave the mounting bolt loose at this time. Mount the throttle cable bracket on the extended section of the throttle body adapter and the bracket support. Tighten the 6mm cap screws. Tighten the support bracket mounting bolt at this time.

*Install the new throttle body and gasket as shown.
If your existing throttle cable will not reach the new throttle cable bracket you will have to replace it with a cable from a 1991-95 YJ.*
